Abstracts

Low Melting Staple Fiber (LMSF) is a specialized type of synthetic fiber with a significantly lower melting point compared to conventional synthetic fibers. Typically made from copolyester (Co-PET) or modified polypropylene (Co-PP), LMSF is designed to melt at temperatures ranging from 85°C to 200°C. This property allows it to act as a thermal adhesive in various applications, reducing the need for chemical adhesives while improving product performance and environmental sustainability. LMSF is widely used in combination with other fibers, such as polyester (PET), polypropylene (PP), or natural fibers, to produce composite materials with enhanced durability, elasticity, and strength. The primary function of LMSF is to serve as a binder fiber. When exposed to heat, LMSF melts and bonds with surrounding fibers, reinforcing the structural integrity of the final product.

The global Low Melting Staple Fiber market size was estimated at USD 2621.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
