### Report Overview:

The relatively low molecular weight nucleic acid drugs, such as miRNA, ASO, siRNA, aptamers, and ribozymes, could be classified as oligonucleotides that do not express proteins directly. Small Nucleic Acid Drugs utilize nucleic acid, which refer to substances such as DNA and RNA that control genetic information, as drugs. These allow targeting of molecules such as mRNA and miRNA that cannot be targeted with traditional low molecular weight drugs and antibody medicines, and there is a great expectation for these drugs as next generation pharmaceuticals. Active research is being conducted globally as it is expected to lead to the creation of drugs which were previously intractable.

The Global Low Molecular Weight Nucleic Acid Drugs Market Size was estimated at USD 93.20 million in 2023 and is projected to reach USD 129.97 million by 2029, exhibiting a CAGR of 5.70% during the forecast period.
