Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low NOx Condensing Gas-Fired Boiler competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Low NOx Condensing Gas-Fired Boiler are boiler equipment that adopt low-nitrogen combustion technology. They mainly use natural gas and other gases as fuel. By optimizing the combustion process and controlling the combustion conditions, they effectively reduce the generation and emission of nitrogen oxides (NOx). The key technologies include advanced burner design, flue gas recirculation technology (FGR), staged combustion technology, precise air-fuel ratio control, etc., which make the combustion more complete and efficient, and at the same time reduce the generation of nitrogen oxides. Low-nitrogen gas boilers are widely used in industrial, commercial, and residential fields, especially in regions and industries with strict environmental protection requirements, such as urban heating, hotels, hospitals, schools, food processing, chemical industry, pharmaceuticals, etc. They can meet users' demands for steam and hot water, while reducing environmental pollution and conforming to increasingly strict environmental protection regulations and emission standards.

The global Low NOx Condensing Gas-Fired Boiler market size was estimated at USD 758.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
