Report Overview

A low NPSH pump is a type of pump that is designed to handle fluids with low net positive suction head (NPSH). NPSH is a measure of the amount of pressure required to keep a fluid from boiling or vaporizing as it passes through the pump. If the NPSH of a fluid is low, the fluid may boil or vaporize as it is pumped, which can cause cavitation and damage to the pump. A low NPSH pump is designed to reduce the risk of cavitation and damage by minimizing the pressure drop of the fluid as it passes through the pump. This is achieved by using specialized impellers, volutes, and suction nozzles that are designed to maintain a high velocity and low pressure drop within the pump.
