Abstracts

A Low Oxygen Copper Rod Continuous Casting and Rolling Line refers to an industrial setup specifically designed for the production of copper rods with low oxygen content. This is important in various applications where high electrical and thermal conductivity is required, as the presence of oxygen can introduce impurities that adversely affect these properties. The continuous casting process involves melting copper, often in a controlled atmosphere to minimize oxygen exposure, and then pouring it into a mold. As the copper cools, it solidifies into a continuous rod or billet. The low oxygen levels are achieved through specialized melting and casting techniques, often utilizing vacuum or inert gas atmospheres. After casting, the solidified copper rod is transferred to a rolling mill where it is mechanically processed (rolled) to achieve the desired dimensions (diameter, length) and mechanical properties. The rolling process also serves to further reduce any remaining oxygen content by working the material and inducing crystallographic changes. After rolling, the copper wire or rod is cooled and coiled. The controlled cooling process is also important to ensure that the material maintains its desired mechanical properties. Producing copper with low oxygen improves conductivity and ductility, making it suitable for high-performance electrical applications.

The global Low Oxygen Copper Rod Continue Casting and Rolling Line market size was estimated at USD 106.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
