Abstracts

Low Pressure Die Casting (LPDC) Services refer to a set of manufacturing services that utilize the low - pressure die - casting process to produce metal components. Process- Mold Preparation: The permanent steel mold is preheated and coated with a release agent to prevent the molten metal from sticking. Then, the mold is sealed.- Filling: The furnace containing the alloy is pressurized, and the molten metal is moved to a shot chamber. It is then introduced into the mold cavity under controlled low pressure, typically between 1 and 2 bars. This filling method reduces turbulence and prevents gas from being trapped.- Solidification: After the molten metal fills the mold, it solidifies under the action of low pressure.- Ejection: After solidification, the casting is taken out, and any excess material, such as the sprue and flash, is carefully trimmed.Characteristics of LPDC-Produced Components- High Quality: Components have minimal porosity, high density, and excellent surface finish, reducing the need for secondary operations.- High Precision: The low-pressure environment ensures accurate dimensional control and good repeatability, which is suitable for components with high-precision requirements.

The global Low Pressure Die Casting (LPDC) Services market size was estimated at USD 9416.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
