Report Overview

Low pressure injection molding is a new injection molding technique that uses low pressure. With this technique, you can inject the hot melted material with the low pressure into the mold cavities, and then solidify the melted material fast within a few seconds to a few minutes. This type of injection molding technology can help improve the speed of production, allowing rapid prototyping services to produce prototypes, parts, and components much faster than usual. It is some kind of production method that different from the 3d printing services. Also, it uses aluminum, silicone or temperature-resistant plastic as the primary material for the injection molds. Aluminum molds are easier and faster to create than steel molds, which can further help improve the speed of production. These machines typically have clamping forces ranging from 5 to 200 tons. They are suitable for producing smaller and simpler plastic parts.
