Abstracts

Low refractive index coating refers to a specialized thin-film material applied to optical surfaces to reduce surface reflection by leveraging a refractive index lower than that of the substrate, typically below 1.4, which minimizes Fresnel reflection losses and enhances light transmission across a broad spectral range. These coatings are engineered using nanoporous or fluorinated materials, such as magnesium fluoride, silica aerogels, or proprietary polymer-based formulations, and are critical in applications where maximizing light throughput, reducing glare, or minimizing optical interference is essential, such as in high-performance lenses, displays, solar panels, and advanced sensor systems. The performance is often characterized by parameters like adhesion durability, environmental stability, and abrasion resistance, in addition to optical properties, making the coating a multidisciplinary product intersecting materials science, optics, and surface engineering.

The global Low Refractive Index Coating market size was estimated at USD 325.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
