Abstracts

Low roughness copper foil, also known as ultra-smooth or low-profile copper foil, is a specialized type of electrodeposited or rolled copper foil engineered with a reduced surface roughness (Rz) on the side that interfaces with dielectric materials, which is critical for high-frequency and high-speed electronic applications where signal integrity, insertion loss, and impedance control are paramount; this foil is characterized by its finely controlled grain structure and minimal peak-to-valley height variations, achieved through advanced manufacturing processes such as precision electroplating, surface treatment, or additive-controlled deposition, making it distinct from standard copper foils used in conventional printed circuit boards (PCBs).

The global Low Roughness Copper Foil market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
