Report Overview

Low sodium refining agent is a flux used in the metal casting industry to remove impurities from molten metal. It is a mixture of various compounds, including chlorides, fluorides, and carbonates, designed to react and dissolve impurities in metals. The use of low sodium refining agents is important in the casting process because impurities can have a negative impact on the quality of the final product. For example, impurities can cause defects such as porosity, shrinkage, and cracks in cast metal. In addition, impurities can affect the mechanical properties of the cast metal, making it more vulnerable and more prone to failure.
