## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low-Temp Curing Conductive Adhesive competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of low-temperature curing conductive adhesives was approximately 8,900 tons, with an average selling price of about US\$63.9 per kilogram. Production capacity in 2024 was 11,200 tons, with an average gross profit margin of approximately 30-40%. Low-Temp Curing Conductive Adhesive is adhesives containing conductive fillers (such as silver powder) and special resin matrices. They can cure rapidly at lower temperatures while maintaining excellent conductivity, thermal conductivity, high adhesion, mechanical strength, and thermal stability, and are often used to replace traditional high-temperature soldering. The upstream of low-temperature curing conductive adhesives mainly includes matrix resins (such as epoxy resins and silicone resins), conductive fillers (mainly silver powder and silver flakes, followed by copper powder and carbon nanotubes), and key additives such as curing agents, diluents, and coupling agents. Downstream applications are primarily in four high-value sectors. In consumer electronics, it's used for precision assembly and electromagnetic shielding of smartphones and wearable devices; in automotive electronics, it serves as weather-resistant packaging for sensors and control modules; in medical devices, it ensures reliable and biocompatible packaging for monitors and implantable devices; and in aerospace, it meets the high-reliability bonding and protection requirements of satellites and avionics systems in extreme environments. Essentially, the technology provides customized solutions for stable interconnection of miniaturized, high-performance electronic systems. Low-temperature curing conductive adhesives, as key materials for high-end electronic packaging, are experiencing structural growth opportunities. In 2024, with the continued rise in demand for advanced

packaging, Mini/Micro LED display technology, and flexible electronics, the market has a particularly urgent need for adhesives that can cure below 150°C and possess high conductivity and reliability. The global market size is expected to grow steadily, with the Asia-Pacific region (especially China) becoming the core of growth due to its strong electronic manufacturing supply chain. From a technological trend perspective, silver-filled products still dominate the high-end market due to their superior conductivity, but research and development of new fillers such as copper-based and carbon nanotubes is active, aiming to balance cost and performance. In terms of the supply chain, international giants hold a leading position with their deep patent portfolios, while domestic companies are accelerating import substitution through technological breakthroughs, especially in the consumer electronics and automotive sectors. The main challenges come from fluctuations in raw material prices (especially silver powder) and stringent customer requirements for cost control, but the industry as a whole is evolving towards high-performance, customized solutions, maintaining high gross margins. In the future, this market will continue to benefit from the dual drivers of semiconductor localization and emerging electronic technologies.

The global Low-Temp Curing Conductive Adhesive market size was estimated at USD 569.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
