## Abstracts

Low-Temperature Ammonia Cracking for Hydrogen Production is a process that decomposes ammonia (NH<sub>3</sub>) into hydrogen (H<sub>2</sub>) and nitrogen (N<sub>2</sub>) at relatively lower temperatures. This method relies on advanced catalysts to reduce the reaction temperature while maintaining high hydrogen yield and energy efficiency. Compared to conventional high-temperature cracking, the low-temperature approach offers advantages such as reduced energy consumption, less demanding material requirements, and faster system startup. It is especially suitable for decentralized hydrogen production, portable energy systems, and clean energy supply in carbon-neutral applications, making it a key emerging technology in the green hydrogen sector.

The global Low-Temperature Ammonia-To-Hydrogen Technology market size was estimated at USD 175.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.80% during the forecast period.
