## Abstracts

A low temperature data logger is a device designed to record temperature data in low - temperature environments. A low temperature data logger typically uses a temperature - sensitive sensor, such as a thermocouple or a resistance temperature detector (RTD), to measure the ambient temperature. The sensor converts the temperature into an electrical signal, which is then processed and digitized by the logger's internal circuitry. The digitized data is stored in the logger's memory for later retrieval and analysis. Some data loggers may also have additional features, such as built - in algorithms to compensate for temperature - related errors and to ensure accurate measurements in low - temperature conditions.

The global Low Temperature Data Logger market size was estimated at USD 318.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
