Report Overview

Low-temperature electrophoretic coating is a coating material, usually made of polymers, used in the electrophoretic coating process at low temperatures. Electrophoretic coating is an electrochemical deposition technology that achieves uniform coating by adsorbing charged particles from a solution to the surface of a workpiece in an electric field. Low-temperature electrophoretic coatings are coatings that are electrophoretically applied at relatively low temperatures, which helps avoid thermal damage to the workpiece during the coating process.

The global Low Temperature Electrophoretic Coating market size was estimated at USD 542.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
