Abstracts

Low-temperature solder wire is a material used for electronic welding. Its melting point is relatively low, generally between 100 and 200 degrees Celsius. It is mainly used for welding work in the fields of electronic product repair, parts repair, DIY and other fields. It is especially suitable for electronic components that are sensitive to welding temperature. The advantage of low-temperature solder wire is that it has low operating temperature, causes little damage to electronic components, and is less prone to problems such as welding bulging and breakage. Compared with traditional high-temperature solder wire, low-temperature solder wire is more suitable for products with higher welding requirements. At the same time, low-temperature solder wire is favored by electronics enthusiasts and DIYers because of its low operating temperature. The low-temperature solder wire market has maintained a steady growth trend over the past few years. With the rapid development of electronic manufacturing, automobile manufacturing and other industries, the demand for welding materials is increasing, which has promoted the continuous expansion of the low-temperature solder wire market. It is expected that in the next few years, with the rise of emerging markets and the continuous advancement of technology, the market size is expected to continue to grow. In addition, in order to meet the needs of different industries and application scenarios, manufacturers are developing new low-temperature solder wires with lower melting points and better welding performance. In summary, the low-temperature solder wire market is currently showing a positive development trend.

The global Low Temperature Solder Wire market size was estimated at USD 1097.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
