Abstracts

Superconductivity is a set of physical properties observed in certain materials where electrical resistance vanishes and magnetic fields are expelled from the material. Any material exhibiting these properties is a superconductor. Superconductors with a critical temperature lower than 40K (-233.15°C) are called low-temperature superconductors, those with a critical temperature higher than 40K (-233.15°C) are called high-temperature superconductors, and those with a critical temperature higher than about 300K (26.85°C) are called room temperature superconductors. The main representatives of low-temperature superconducting alloys include niobium-titanium alloy (NbTi), niobium-tin alloy (Nb₃Sn), niobium-aluminum alloy (Nb₃Al) and other alloys. However, currently the only commercialized low-temperature superconducting alloys are niobium-titanium alloy (NbTi) and niobium-tin alloys (Nb₃Sn).

The global Low Temperature Superconducting Alloys market size was estimated at USD 325.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
