## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low-temperature Thermoplastic Orthosis competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of low-temperature thermoplastic orthoses will reach 6.2459 million units, with an average selling price of US\$83.14 per unit. Low-temperature thermoplastic orthoses are rehabilitation assistive devices made from thermoplastic polymer materials (such as polyethylene and polypropylene). Their core characteristic is that the material can soften and shape at low temperatures of 60-70°C and then rapidly solidify upon cooling to maintain a specific shape. This type of orthosis uses a low-temperature molding process involving heating, shaping, and cooling to achieve precise correction, fixed support, and functional protection for limbs, joints, or the spine. It is widely used in clinical scenarios such as orthopedic postoperative fixation, sports injury rehabilitation, muscle tone regulation after nerve damage, and congenital deformity correction. Its lightweight, adjustable, and biocompatible design meet the demands of modern rehabilitation medicine for personalized, non-invasive treatment. Low-temperature thermoplastic orthoses have a gross profit margin of 21.49% and a gross profit of \$17.87. The single-line production capacity is 250,000-300,000 units/year.

The global Low-temperature Thermoplastic Orthosis market size was estimated at USD 519.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
