Report Overview

Low temperature welding machine, also known as cold welding machine, is called ESD in the world. It was developed by experts in the former Soviet Union using circuit principles similar to EDM. The maximum coating thickness of the original processing machine can only reach 30 ? M, so it can not meet the repair needs. After a lot of research and development, its output power has been increased, and the structure of the welding gun and the composition of the electrode material have been improved. The principle is that the special welding wire is fused to the damaged part of the workpiece through the high heat energy generated by the micro electric instantaneous discharge, and is firmly welded with the original base material. After welding, only a little polishing is required.

This report provides a deep insight into the global Low Temperature Welding Machine market covering all its essential aspects.
