Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low Thermal Expansion Alloy competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Global sales of low thermal expansion alloys reached 13,755 tons in 2024, with an average selling price of US\$21,773 per ton. Low thermal expansion alloys (Invar type) generally refer to alloys with an average linear expansion coefficient $3 \times 10^{-6}/^{\circ}\text{C}$ within the temperature range of -60°C to 500°C . Their core characteristic is that their dimensions hardly change with temperature. Note: The chemical composition of expansion alloys must be accurately controlled during the manufacturing process. Their products are generally bars, plates, strips, wires, and tubes. This report's statistics cover the aforementioned bar, plate, strip, wire, and tube products. The typical composition of low thermal expansion alloys is approximately 36% Ni with the remainder being Fe (Invar 36). The raw materials have a high nickel content and require vacuum-grade pure iron. Nickel price fluctuations directly determine costs; raw material costs typically account for over 55% of the total cost. Adding the costs of vacuum melting, homogenization annealing, and multiple cold rolling processes, the processing and testing costs account for about 35%, and these costs are linked to monthly LME nickel prices.

The global Low Thermal Expansion Alloy market size was estimated at USD 299.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.40% during the forecast period.
