Abstracts

A low vacuum carbon coater is a specialized thin-film deposition instrument designed to apply a uniform, conductive layer of amorphous carbon onto samples under reduced pressure conditions, typically operating in the range of 10^{-2} to 10 Pa. Unlike high-vacuum systems, it does not require ultra-high vacuum environments, making it more accessible and cost-effective for applications where extreme purity is not critical. This equipment is widely used in electron microscopy (especially scanning electron microscopy) to prevent charging of non-conductive specimens, enhance secondary electron emission, and improve image quality. It is also employed in materials science, life sciences, and failure analysis for coating delicate or insulating samples prior to imaging or analysis. The system generally consists of a vacuum chamber, carbon evaporation source (such as carbon rods or threads), power supply, and control unit, balancing performance with operational simplicity.

The global Low Vacuum Carbon Coater market size was estimated at USD 85.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
