Report Overview:

LVDS chips are semiconductor devices that provide a means of a balanced digital transmission method. Low-voltage differential signaling, or LVDS, is a technical standard that specifies electrical characteristics of a differential, serial signaling standard, but it is not a protocol. LVDS operates at low power and can run at very high speeds using inexpensive twisted-pair copper cables. LVDS is a physical layer specification only; many data communication standards and applications use it and add a data link layer as defined in the OSI model on top of it.

The Global Low-Voltage Differential Signaling (LVDS) Chip Market Size was estimated at USD 262.25 million in 2023 and is projected to reach USD 363.66 million by 2029, exhibiting a CAGR of 5.60% during the forecast period.
