Report Overview

LVDS chips are semiconductor devices that provide a means of a balanced digital transmission method. Low-voltage differential signaling, or LVDS, is a technical standard that specifies electrical characteristics of a differential, serial signaling standard, but it is not a protocol. LVDS operates at low power and can run at very high speeds using inexpensive twisted-pair copper cables. LVDS is a physical layer specification only; many data communication standards and applications use it and add a data link layer as defined in the OSI model on top of it.
