Report Overview

Low Voltage Electro-optic Modulator is a device used to modulate optical signals, it can use the action of electric field to change the refractive index of light to modulate the transmission characteristics of light. The working principle of this modulator is based on an optical effect known as the electro-optic effect. When an electric field is added to an optical material, a change in the refractive index will occur, resulting in a change in the phase and amplitude of light, thereby realizing the modulation of the optical signal. A low-voltage electro-optic modulator is a modulating device that operates at low voltage and high speed, so it is widely used in optical fiber communication and optoelectronics.

The global Low Voltage Electro Optic Modulator market size was estimated at USD 345.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
