## Abstracts

This report focus on Low-voltage Interface Relay market. Any electromagnetic relay has a certain level of isolation between the input and output circuits. However, in ordinary relays, this function is not prevalent and, hence, not considered in the existing system of relay classification. In interface relays, however, the property of galvanic isolation (decoupling) between the input and output circuits is significantly bolstered, and parameters of the galvanic isolation have an utmost importance from standpoint of the functions performed by this relay. On the other hand, the parameters associated with switching capacity are secondary and can significantly vary in interface relays with the same level of galvanic decoupling. In this respect, categorization of interface relays into existing classes of ordinary relays is arguable. Rather, it seems more appropriate to categorize them as a separate class of electrical relays and classify according to characteristics of the galvanic decoupling unit. The industrial sector has been evolving rapidly with the continual introduction of sophisticated technologies such as robotics, artificial intelligence, and more. Additionally, the automation enables swift operations of manufacturing and material handling with the use of intelligent manufacturing infrastructure. Industries are deploying industrial automation and control systems in an attempt to increase productivity and reduce labor costs. Moreover, with the advent of Industry 4.0, the manufacturing sector has been experiencing rapid adoption of new systems and augmented networking architectures, which is projected to provide significant opportunities for market growth.

The global Low-voltage Interface Relay market size was estimated at USD 1485.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
