Report Overview

This report focus on Low-voltage Interface Relay market. Any electromagnetic relay has a certain level of isolation between the input and output circuits. However, in ordinary relays, this function is not prevalent and, hence, not considered in the existing system of relay classification. In interface relays, however, the property of galvanic isolation (decoupling) between the input and output circuits is significantly bolstered, and parameters of the galvanic isolation have an utmost importance from standpoint of the functions performed by this relay. On the other hand, the parameters associated with switching capacity are secondary and can significantly vary in interface relays with the same level of galvanic decoupling. In this respect, categorization of interface relays into existing classes of ordinary relays is arguable. Rather, it seems more appropriate to categorize them as a separate class of electrical relays and classify according to characteristics of the galvanic decoupling unit.
