Abstracts

Isocyanate silanes are specialized organosilicon compounds characterized by the presence of reactive isocyanate (-NCO) groups and hydrolyzable alkoxysilane (-Si(OR)?) functionalities within the same molecule. This unique bifunctional structure enables them to act as effective adhesion promoters, crosslinking agents, and surface modifiers by facilitating strong covalent bonds between organic polymers and inorganic substrates. Upon exposure to moisture, the alkoxysilane groups hydrolyze to form silanol groups, which can condense with hydroxyl groups on inorganic surfaces such as glass, metals, or minerals. Simultaneously, the isocyanate groups can react with nucleophilic sites, including hydroxyl, amino, or carboxyl groups, in organic polymers.

The global Isocyanate Silanes market size was estimated at USD 86.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
