Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on LTCC Paste competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. LTCC Paste refers to specialized functional pastes used in the Low Temperature Co-fired Ceramic (LTCC) process, which allows multilayer ceramic modules to be co-fired with internal and external conductive elements at temperatures below 900°C. LTCC pastes are categorized into several key types: conductor pastes (e.g., silver, silver-palladium, copper, or gold-based) for internal interconnects and external terminals; dielectric pastes for embedded capacitors and insulation layers; resistor pastes for integrated resistive components; and via/barrier isolation pastes to ensure circuit separation and thermal management. These pastes are screen-printed onto green tapes or LTCC substrates and co-fired with the ceramic layers to form highly integrated, miniaturized modules. They are widely used in RF modules, antenna-integrated components, radar sensors, 5G/6G communication devices, automotive electronics, and embedded passive components in system-in-package (SiP) architectures. The evolution of LTCC paste technology is driven by the demand for higher frequencies, increased integration density, and environmental compliance. First, enhanced electrical performance for high-frequency applications is a key trend, especially in mmWave, automotive radar, and advanced wireless systems. This requires ultra-low-loss conductor pastes with high conductivity, excellent sintering characteristics, and compatibility with low-temperature dielectric materials. Second, the development of RoHS-compliant, lead-free, and low-temperature sintering pastes is gaining momentum to support green manufacturing and broader compatibility with base materials and conductors like copper. Third, the localization and customization of LTCC paste systems is accelerating, particularly in China, where domestic suppliers such as Dalian Overseas Huasheng Electronics

Technology are advancing formulations for high-Q, low-CTE, and multilayer co-firing reliability. These innovations are supporting the transition of LTCC from passive RF components to full-system integration platforms across automotive, aerospace, telecom, and industrial sectors.

The global LTCC Paste market size was estimated at USD 227.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
