Abstracts

Lubricity improver additives are specialized chemical compounds blended into fuels and lubricants, primarily diesel and certain industrial oils, to reduce friction and wear between moving parts by enhancing the lubricating properties of the base fluid, especially under high-pressure or boundary lubrication conditions; these additives typically contain polar molecules, such as fatty acid esters or specific polymers, which form a protective film on metal surfaces, thereby minimizing direct metal-to-metal contact, preventing scoring and premature component failure, and contributing to improved fuel efficiency and extended engine life in applications where lubricity has been compromised, such as in ultra-low sulfur diesel fuels which inherently possess reduced natural lubricating qualities.

The global Lubricity Improver Additive market size was estimated at USD 204.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Lubricity Improver Additive market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
