Report Overview

Luggage Scanners use this technology. Once the luggage is inside, one side of the scanner releases X-rays. These X-rays pass through the bag and some of the energy of the X-rays is absorbed by the various objects in the bag, whereas the empty spaces do not block the X-rays and the waves go through without any change in intensity. These waves then hit the first plate-like detector. Before hitting the second detector, the material between the two detectors blocks the low-energy waves, so that only the high-energy waves hit the second plate. The outputs of these plates are compared, which helps us know the materials of the various objects inside the bag.
