Report Overview

A luminescent solar concentrator (LSC) is a clear piece of glass or plastic that has fluorescent dye or quantum dots embedded in it or painted on it. The dye absorbs incident light then fluoresces creating a glow that spreads by total internal reflection to the sheet's edge where light can be absorbed by a narrow solar cell. LSC is a really promising technology as it enables a large collecting area made of nearly transparent glass with a relatively small area of expensive solar cells. The concentration factor can be defined as the ratio of the aperture to the edge. The luminescent materials can be tuned for absorption at certain wavelengths (as an example ultraviolet UV) and re-emit at longer wavelengths that are optimal for absorption by silicon. Luminescent Solar Concentrator Cells (LSCc) are a type of solar technology that uses luminescent materials to capture and concentrate sunlight onto solar cells. These cells can be integrated into windows, building facades, or other transparent surfaces to generate electricity while allowing light to pass through. The luminescent materials absorb sunlight and re-emit it at longer wavelengths, which is then captured by solar cells at the edges of the device.

The global Luminescent Solar Concentrator Cells (LSCc) market size was estimated at USD 750 million in 2023 and is projected to reach USD 2164.88 million by 2032, exhibiting a CAGR of 12.50% during the forecast period.
