Abstracts

A lumpectomy is a form of breast-conserving and preservation surgery used for the removal of breast tumor or some surrounding tissues. It is also known as a partial mastectomy because a part of breast tissue is removed in this procedure, whereas in mastectomy, the full breast is removed to avoid chances of cancer development in future. The lumpectomy therapy market is primarily driven by the increasing incidence of breast cancer and the growing preference for breast-conserving surgeries like lumpectomies over mastectomies. Patients often choose lumpectomies due to the potential for less physical and emotional trauma. Additionally, advancements in surgical techniques and technologies are enhancing the success rates of lumpectomies, further boosting their demand. However, challenges in this market include the need for comprehensive post-surgery care, including radiation therapy, to reduce the risk of cancer recurrence. Access to such therapies and their associated costs can be barriers for some patients. Moreover, ensuring complete tumor removal during lumpectomies is essential, and surgeons must strike a balance between conserving breast tissue and achieving optimal cancer treatment outcomes. These challenges highlight the importance of continued research and advancements in lumpectomy therapies to address the complex needs of breast cancer patients effectively.

The global Lumpectomy Therapy market size was estimated at USD 1788.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
