### Report Overview

Lymphangiomyomatosis (LAM) is a rare lung disease that affects mostly women of childbearing age (the years between puberty and menopause when it is possible to become pregnant). In people who have LAM, abnormal muscle-like cells begin to grow out of control in the lungs and other parts of the body. Over time, these LAM cells can destroy healthy lung tissue. As a result, fluid-filled pockets called cysts may develop, preventing air from moving freely in and out of the lungs. This can lower the amount of oxygen that reaches the rest of the body.

The global Lymphangiomyomatosis (LAM) market size was estimated at USD 142 million in 2023 and is projected to reach USD 229.91 million by 2032, exhibiting a CAGR of 5.50% during the forecast period.
