Abstracts

Lymphangiomyomatosis (LAM) is a rare lung disease that affects mostly women of childbearing age (the years between puberty and menopause when it is possible to become pregnant). In people who have LAM, abnormal muscle-like cells begin to grow out of control in the lungs and other parts of the body. Over time, these LAM cells can destroy healthy lung tissue. As a result, fluid-filled pockets called cysts may develop, preventing air from moving freely in and out of the lungs. This can lower the amount of oxygen that reaches the rest of the body. Market CAGR for lymphangiomyomatosis is being driven by the growing development of targeted therapies and personalized treatment approaches. As the understanding of molecular mechanisms underlying LAM continues to advance, there is growing recognition of the heterogeneity of the disease and the need for tailored treatment strategies to address individual patient characteristics. Targeted therapies, which specifically aim to inhibit key pathways involved in LAM pathogenesis, hold immense promise for improving patient outcomes and slowing disease progression.

The global Lymphangiomyomatosis (LAM) market size was estimated at USD 151.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
