Report Overview:

Machine vision (MV) systems use one or more video cameras, digital signal processing, and analog-to-digital conversion to allow a computer to observe, inspect and scrutinize task performance. The data is subsequently sent to a computer, which analyses it and generates the desired output. Any machine vision system must have both high resolution and sensitivity. Resolution is responsible for distinguishing between things, whereas sensitivity refers to the machine's ability to detect objects or weak signals in dim light or at wavelengths invisible to the naked eye. In implementing computer vision solutions in their facilities, logistics providers can avoid wasting time searching for misplaced assets and manually confirming asset locations. They can also use the analyses from visual AI to further optimize operations and accurately determine inventory stock levels.

The Global Machine Vision Logistic Market Size was estimated at USD 3515.37 million in 2023 and is projected to reach USD 5516.76 million by 2029, exhibiting a CAGR of 7.80% during the forecast period.
