Abstracts

Macro synthetic fibers for concrete reinforcement are an innovative and effective solution in modern construction. These synthetic fibers, made from materials like polypropylene, polyethylene, nylon, or in hybrid forms, are added to concrete mixtures to enhance its performance significantly. They improve the concrete's tensile strength, which is crucial as concrete is typically strong in compression but weak in tension. By distributing evenly within the concrete matrix, macro synthetic fibers help control cracking. Whether it's due to shrinkage during the curing process, thermal expansion and contraction, or the application of external loads. In industrial settings, they make floors more resistant to abrasion from heavy machinery. For pre - cast elements, they ensure better handling and durability. In road construction, they enhance the performance of pavements under traffic. In buildings, they contribute to the strength and integrity of slabs, walls, and columns. Their use not only extends the lifespan of concrete structures but also reduces maintenance costs over time, making them a valuable addition to any concrete - based construction project.

The global Macro Synthetic Fiber for Concrete Reinforcement market size was estimated at USD 1042.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
