## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Macromolecular Colorant competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Macromolecular colorants are a class of organic or inorganic coloring materials with large molecular weights, commonly used for coloring polymers, plastics, fibers, coatings, and other materials. They bind to the substrate through dissolution or dispersion, imparting not only vibrant and stable colors but also excellent lightfastness, weather resistance, and chemical resistance. Due to their large molecular structure, macromolecular colorants are widely used in industries such as plastics, optical devices, automobiles, building materials, and textiles, meeting the coloring requirements for high performance and environmental friendliness. The macromolecular colorant industry chain encompasses upstream supply of resin monomers, organic pigment intermediates such as azo/anthraquinone, and additives; midstream synthesis, dispersion processing, and granulation of polymer colorants/polymeric dyes; and downstream coloring applications in industries such as plastics, fibers, coatings, inks, electronics, and automobiles. Due to high technological barriers and long customer validation cycles, midstream macromolecular colorant companies typically maintain a gross profit margin of 25%-40%, with high-performance products reaching over 45%. Meanwhile, the industry chain is characterized by customization and high stickiness; equipment investment is relatively small, but order volatility is high. Therefore, the overall industry capacity utilization rate is usually between 60% and 80%, with leading companies maintaining rates above 80% due to order stability and differentiation capabilities. In 2024, global macromolecular colorant production reached 19,613 tons, with an average selling price of \$26 per kilogram. Macromolecular colorants have become an important choice for coloring solutions in many industries due to their

excellent weather resistance, color stability and environmental protection characteristics. Compared with traditional small molecule dyes, macromolecular colorants show stronger light resistance and durability in the fields of plastics, textiles and coatings, especially in demanding applications such as automobiles, construction and electronics. In addition, with the increasingly stringent environmental regulations, the low migration and non-toxic characteristics of macromolecular colorants have made them increasingly valued under the trend of green manufacturing and sustainable development. However, their complex production process and high cost also put forward higher R&D and cost control requirements for enterprises.

The global Macromolecular Colorant market size was estimated at USD 550.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
