Abstracts

Macrophage anticancer therapy is an immunotherapy that utilizes the anticancer activity of macrophages. Macrophages are important cells in the immune system with multiple functions, including phagocytosis, killing of pathogens and tumor cells, and regulation of immune responses. In macrophage anticancer therapy, macrophages are activated or modified to more effectively recognize and attack tumor cells. This therapy can be achieved through various routes, such as direct injection of activated macrophages into the tumor site or using gene engineering techniques to modify macrophages to have stronger anticancer abilities. Macrophage anticancer therapy provides new ideas and methods for tumor treatment and brings hope to cancer patients.
