Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Macroreticular Adsorbents competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Macroporous adsorbent, also known as polymer adsorption resin or polymer adsorbent, is a non-ionic polymer material with a highly cross-linked, porous structure. It is prepared by suspension polymerization of monomers such as styrene, divinylbenzene or methacrylate, plus a cross-linking agent, a porogen and a dispersant. After the polymer is formed, the porogen is removed, leaving holes of different sizes, shapes and mutual penetration in the resin. Therefore, the macroporous resin has a higher porosity and a larger pore size in the drying stage, between 100 and 1000nm, so it is also called macroporous adsorption resin. The pore structure of this resin gives it a large specific surface area and pore volume, so that it can effectively adsorb the target molecules in the solution. It can selectively adsorb the target molecules in the solution through physical adsorption, and is often used to separate, purify and concentrate target substances, especially in the fields of biomedicine, chemical industry, food, etc.

The global Macroreticular Adsorbents market size was estimated at USD 229.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
