Abstracts

Magnesia carbon refractories are a class of refractory materials primarily composed of magnesia (MgO) and carbon, with the carbon typically sourced from graphite or carbon black, and often reinforced with metallic antioxidants such as aluminum or magnesium to enhance oxidation resistance. These materials are engineered to withstand extreme thermal, mechanical, and chemical conditions, particularly in basic oxygen and electric arc furnaces within the steelmaking industry, where their high thermal conductivity, excellent slag resistance, and thermal shock stability make them indispensable for linings, converters, and ladles. The product's performance is largely defined by the MgO content, carbon ratio, and binder systems used, making it a critical high-performance ceramic-carbon composite tailored for demanding high-temperature applications.

The global Magnesia Carbon Refractories market size was estimated at USD 1950.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
