Abstracts

Magnesium aluminum alloy, commonly referred to as magnesium-aluminum (Mg-Al) alloy, is a lightweight metallic material composed primarily of magnesium with aluminum as the principal alloying element, often supplemented with zinc, manganese, or rare earth elements to enhance specific properties such as strength, corrosion resistance, and castability. These alloys are characterized by their high strength-to-weight ratio, excellent damping capacity, and good machinability, making them suitable for applications where weight reduction is critical without compromising structural integrity. They are widely utilized in industries such as automotive (for components like transmission cases and steering wheels), aerospace (in aircraft seating and interior parts), consumer electronics (for laptop casings and mobile device frames), and sports equipment (e.g., bicycles and handheld tools), driven by the ongoing demand for materials that contribute to energy efficiency, portability, and performance enhancement.

The global Magnesium Aluminum Alloy market size was estimated at USD 4218.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
