Abstracts

Magnesium phosphate cement (MPC) is a type of chemically bonded ceramic material formed through an acid-base reaction between dead-burned magnesia (MgO) and a soluble phosphate, typically ammonium dihydrogen phosphate (NH₄H₂PO₄) or potassium dihydrogen phosphate (KH₂PO₄), which results in the rapid formation of magnesium phosphate hydrates as the binding phase. This material is distinguished by its exceptionally fast setting time, high early strength development, excellent adhesion to existing substrates, low permeability, and good durability in various environmental conditions, making it particularly suitable for applications requiring rapid repair, such as in civil engineering, infrastructure rehabilitation, and emergency construction, as well as in specialized fields like biomedical implants and nuclear waste encapsulation due to its biocompatibility and chemical stability.

The global Magnesium Phosphate Cement market size was estimated at USD 125.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
