Report Overview

Magnesium rod, also known as anode rod, its main component is magnesium, which is placed inside the water heater liner to protect the liner. Some electric water heaters have metal liners (mainly composed of iron), and the water inside the liner, chemicals in the water, and oxygen will react with the metal and corrode it. If this phenomenon is allowed to occur, the lifespan of the water heater will be shortened. To prevent this situation, the magnesium rod demonstrates the spirit of sacrificing the ego and completing the greater self, replacing metal corrosion.
