## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Magnesium Sacrificial Anode competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A magnesium sacrificial anode is a highly active corrosion protection component used in cathodic protection systems for metallic structures exposed to soil or freshwater environments. Due to magnesium's more negative electrochemical potential compared to steel or iron, it acts as the anode in a galvanic cell, corroding preferentially to protect the underlying metal. When connected electrically to pipelines, water heaters, underground tanks, or steel pilings, magnesium anodes provide a consistent flow of protective current, preventing oxidation of the main structure. Magnesium anodes are especially effective in high-resistivity environments like dry soils or low-conductivity freshwater, where other anode types (such as zinc or aluminum) are less efficient. They are available in various shapes—rods, blocks, ribbon-type—and are often packaged with backfill material to enhance performance and longevity. Key advantages include their high driving voltage, strong protection current, and suitability for use without external power. Magnesium sacrificial anodes are widely used in gas and water pipelines, domestic hot water systems, buried structures, and storage vessels requiring long-term, low-maintenance corrosion protection. The global magnesium sacrificial anode market is a vital segment within the broader cathodic protection industry, particularly valued for its application in high-resistivity environments such as dry soil and freshwater systems. These anodes are widely used in pipelines, underground storage tanks, steel foundations, water heaters, and other buried or submerged metallic structures that require long-term corrosion control. Magnesium's high driving potential and strong current output make it especially suitable for areas where zinc or aluminum anodes are less effective. As infrastructure around the world continues to age, and governments

invest in asset protection and environmental safety, the demand for reliable, cost-effective corrosion mitigation technologies continues to rise. Magnesium anodes are preferred for their ease of installation, self-regulating performance, and ability to operate without external power. In addition to traditional uses in oil, gas, and water pipelines, newer applications in smart water grids, district heating systems, and renewable energy infrastructure are also driving market interest. Technological developments have focused on optimizing magnesium alloy compositions for longer lifespan and higher efficiency, as well as on creating more compact, form-fitting designs tailored to specific site conditions. The market is also influenced by regional variations in soil characteristics, groundwater chemistry, and construction regulations, which shape the selection and placement of anodes. Overall, magnesium sacrificial anodes remain an essential solution for corrosion protection in challenging environments, offering a balance of performance, affordability, and sustainability across a wide range of industries and geographies.

The global Magnesium Sacrificial Anode market size was estimated at USD 726.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
