### Report Overview

The magnetic balance current sensor, also known as the closed-loop Hall current sensor, is that the magnetic field formed in the core of the original edge current sensor is compensated by the magnetic field formed by the auxiliary edge compensation coil current, so that the Hall device is in the working state of zero magnetic flux. The original edge current Reflected proportionally. When a current in the main circuit passes, the magnetic field generated on the magnetic wire is gathered by the magnetic core and induced to the Hall device, and the formed signal is exported to drive the power tube and connect it to obtain a compensation current. This current passes through multiple The turn resistance produces a magnetic field that is in direct opposition to the magnetic field produced by the measured current. Based on Hall effect technology, it is used to measure DC, AC or pulsating current, with galvanic isolation between primary and secondary circuits, wide frequency range, good overall accuracy, fast response time, no insertion loss, good linearity, and a variety of size and package options are available.
