Report Overview

In molecular biology, magnetic beads provide a simple and reliable method for purifying various types of biological molecules, including genomic DNA, plasmids, mitochondrial DNA, RNA, and proteins. The advantage of using magnetic beads is that it eliminates the steps of centrifugation or filtration involved in traditional protein purification methods. Magnetic beads are often used as solid phase materials for protein and antibody purification. Magnetic beads are small particles with magnetism, typically composed of magnetic materials such as ferrite and surface modification layers. In the process of protein and antibody purification, magnetic beads can bind to the target protein or antibody through specific affinity or ion exchange ligands, thereby achieving selective separation and purification. Magnetic beads have many advantages in protein and antibody purification, including high selectivity, high purity, ease of operation, rapid separation, and reusability. Therefore, magnetic beads have become one of the commonly used solid-phase materials in the field of protein and antibody purification.

The global Magnetic Beads For Protein and Antibody Purification market size was estimated at USD 169.40 million in 2023 and is projected to reach USD 232.89 million by 2032, exhibiting a CAGR of 3.60% during the forecast period.
