Report Overview:

The Magnetic Levitation Bearing Turbo Blower, also known as magnetic suspension blower or maglev turbo blower is a kind of mechanical equipment for conveying gas. The permanent magnet biased magnetic bearing system supports the rotor system through the permanent magnetic field and electromagnetic field. When starting and stopping, the rotor is in suspension state. During the whole operation cycle, there is no physical contact between the bearing and the shaft, and there is no friction at all, which can maximize the efficiency of the whole equipment.

When the maglev turbo blower is started, the rotor is suspended first, and then the speed is increased. When the maglev turbo blower is stopped, the rotor speed is first reduced to a static state, and then the suspension is stopped. There is no problem of dry grinding, and the frequency of start and stop is unlimited, and the operation is more stable and reliable. The high-speed rotating rotor can still be safely shut down without causing serious damage to the equipment. It is a high-tech, green, energy-saving and environment-friendly product.

The Global Magnetic Bearing Centrifugal Blowers Market Size was estimated at USD 336.64 million in 2023 and is projected to reach USD 845.97 million by 2029, exhibiting a CAGR of 16.60% during the forecast period.
