Abstracts

Magnetic central heating filters are advanced water purification devices designed for central heating systems. They also rely on the powerful magnetic field effect to efficiently capture and remove various magnetic impurities in the heating circulating water, such as iron filings and metal particles. If these impurities accumulate in the heating pipes, they will not only reduce the heating efficiency, but may also cause serious consequences such as pipe blockage and equipment damage. Magnetic central heating filters effectively extend the service life of the heating system and improve the heating effect by continuously purifying the water quality. At the same time, its compact structure design and convenient maintenance method also make it an ideal choice for modern home heating systems.

The global Magnetic Central Heating Filters market size was estimated at USD 1554.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
