Abstracts

Magnetic Coagulation and Sedimentation System is a specialized water treatment technology that integrates magnetic coagulation with sedimentation processes to enhance the removal of fine particles and contaminants from water. In this system, coagulants are first added to destabilize and aggregate suspended solids, forming flocs. Magnetic particles are then introduced, which bind to the flocs, increasing their density and responsiveness to magnetic fields. These magnetized flocs are more easily separated from the water through sedimentation, significantly accelerating settling rates and improving overall treatment efficiency. This system is widely used in industrial wastewater treatment, municipal water purification, and other applications where rapid and efficient solid-liquid separation is required.

The global Magnetic Coagulation and Sedimentation System market size was estimated at USD 84.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
