Abstracts

Magnetic core materials are specialized substances engineered to provide a controlled magnetic path in electromagnetic devices by concentrating and guiding magnetic flux, with their performance primarily determined by key properties such as magnetic permeability, saturation flux density, core losses, and temperature stability. These materials are categorized into soft magnetic materials?including silicon steel, ferrites, powdered iron, and amorphous or nanocrystalline alloys?which are designed for efficient magnetization and demagnetization in alternating current applications like transformers and inductors, and hard magnetic materials, such as rare-earth magnets, which retain magnetization and are used in permanent magnet applications. The selection of a specific core material depends on operational requirements like frequency range, power level, efficiency targets, and environmental conditions, making them fundamental components in industries ranging from power generation and electronics to automotive and renewable energy systems.

The global Magnetic Core Materials market size was estimated at USD 1140.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
