## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Magnetic Electrode competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of magnetic electrodes was approximately 2-5 million pieces, with an average selling price of about \$10-70 per piece and a gross profit margin of about 55%. Single-line production capacity was approximately 20,000-30,000 pieces per year. Magnetic electrodes are electrodes made of materials with ferromagnetic or ferrimagnetic properties. These materials can be magnetized under an applied magnetic field and typically possess remanence. In fields such as electrochemistry, electronics, and biomedicine, magnetic electrodes not only perform the basic function of conducting current like traditional electrodes but also possess additional functions and control capabilities due to their unique magnetic properties. The upstream supply chain for magnetic electrodes mainly consists of the mining of raw materials such as rare earth elements (e.g., neodymium, dysprosium) and metals (e.g., iron, cobalt, nickel) and the manufacturing of high-purity magnetic materials (e.g., neodymium iron boron, ferrite). The midstream is the core link, involving the design, micromachining, coating, and packaging of magnetic electrode components, integrating magnetic functionality with conductive structures. Downstream applications include biomedical sensors, brain-computer interfaces, MRAM memory chips, and high-efficiency electrolytic cells. The demand stems from the pursuit of "dual magneto-electric control" capabilities by downstream high-tech industries: the biomedical field's need for high-sensitivity detection and precise neural intervention, the electronic information industry's need for non-volatile memory, and the green energy field's need for efficient electrochemical conversion, all of which drive the development of magnetic electrode technology and the market.

The global Magnetic Electrode market size was estimated at USD 60.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.00% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Magnetic Electrode market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
